/lab_host="E. coli strain SOLR"
/note="Vector: pBluescript SK +/-; Site_l: EcoRI; Site_l: XhoI; cDNA was prepared from polyA+ enriched RNA from the mixture of cotyledons of five days old plants and leaves of two weeks old plants. The cDNA was directionally ligated into the Uni-ZAP XR vector from Stratagene and packaged using Giapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda=ZAP phage using Ex-Assist helper phage and propagated in SOLR cells."

ECORI, Site_2: Xho!; mRNA was purified from 2 x 10E3
rhabditiform larvae which had been isolated from gerbils experimentally infected dogs. cDNA was constructed from experimentally infected dogs. cDNA was constructed and, using adaptors, was cloned unidirectionally into the vector from the Ecori site to the Xho! site. The library has an unamplified titer of 1 x 10E5 ptu/ml and an amplified, undiluted titer of 9 x 10E11 pfu/ml. The average libsert size of the unamplified library is 675 bp (range, 100-1700)."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B. cereus BCM 4

This sequence represents a Leptospira DNA sequence isolated from the pathogonic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species limmunity against pathogenic LS bacteria can be used for conferring protective bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for prophylactic or therapeutic treatment of diagnosis of past or present LS infection.

                                                        Claim
```

The invention relates to a method for monitoring oil contamination of sea water by detecting, in the sea water, a microbe having the following properties: (1) it has no flagellum; (2) it is a Gram-negative bacterium; (3) it belongs to Proteobacteria, gamma subdivision; (4) it cannot assimilate glucose as a single carbon source; and (5) it efficiently a similate glucose as a single carbon source; and (5) it efficiently a fragment of the 16s rDNA gene from the microbe of the invention, isolate K3.3.

The invention relates to a new method for the production of taxane and paclitaxel compounds that comprises culturing bacteria isolated from a bacteria. The methods can be used for the production of taxanes such species of Taxus or bacteria produced by mutating the isolated bacteria. The methods can be used for the production of taxanes such as paclitaxel, 10-deacetylcephalomannine, 7-epitaxol, 10-deacetyl-baccatin 11, cephalomannine, 7-epitaxol, 7-xylosyl-baccatin 111, cephalomannine, taxaninine, delta-benzoyloxy taxadifine, 9-acetyloxy taxusin, 9-hydroxy taxusin, taxusin, 10-deacetyl-baccatin 111, raylosyl-taxadifine, 9-acetyloxy taxadifine, 9-acetyloxy taxadifine, 9-acetyloxy taxanel 10, tax

The pectate lyase enzymes are obtained from Bacillus agaradhaerens (BA), Bacillus licheniformis (BL), bacillus halodurans (BH) and other Bacillus species. The pectate lyase enzymes can be used for degrading pectin, pectate and polygalacturonides. They can be used in febrergent compositions, for cleaning hard surfaces, for machine treatment of fabrics, for improving the properties of cellulosic fibres, yarn, woven or non-woven fabric, for the degradation of plant material (e.g. recycled waste paper, mechanical paper-making pulps or fibres subjected to a retting process, for preparing animal feed or for processing wine or juice. DNA encoding the enzymes can also be used for the production of

AA112. This bacterium encodes a mannanse enzyme (also known as mannan endo-1,4-beta-mannosidase, beta-mannanase, or endo-1,4-mannanase). The mannanase hydrolyses galactomannans. Specifically, mannanases hydrolyses 1.4-beta-D-mannosidic linkages in mannans, galactomannans, plucomannans, and galactoglucomannans. The mannanase protein or preparations containing it, are used to improve properties of callulosic or synthetic fibres, yarn or (non)woven fabrics (removal of mannan-based

sizes or printing pastes). They are also used to degrade or modify plant materials (particularly recycled waste paper, paper making pulps, or material containing quar or locust bean gums (thickeners), or to reduce viscosity of mannan-containing foods or feeds). The mannanases are also used to process coffee extracts (to inhibit gel formation); in cleaning compositions (for machine washing of fabrics, as hard-surface cleaners, for hand or machine dishwashing, also in oral, dental, contact lens or body-care compositions) where they remove mannan-containing soils and prevent binding of some soils to cellulosics; and in fabric softeners. They can also be used in oil well drilling to fracture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300

                                                                                                                                                                                            The invention relates to a method for monitoring oil contamination of sea water by detecting, in the sea water, a microbe having the following properties: (1) it has no flagellum; (2) it is a Gram-negative bacterium (3) It belongs to Proteobacteria, gamma subdivision; (4) it cannot assimilate glucose as a single carbon source; and (5) it efficiently assimilates at least one of 10-30c n-alkanes. This sequence represents a fragment of the 16s rDNA gene from the microbe of the invention.
                                        Monitoring of oil contamination of sea water - where oil contamination is evaluated by detection of a microbe having properties from e.g. having no flagellum, being a Gram-negative bacterium, belonging to Proteobacteria, gamma subdivision, etc. 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             403

The invention relates to a method for monitoring oil contamination of sea water by detecting, in the sea water, a microbe having the following properties: (1) it has no flagellum; (2) it is a Gram-negative bacterium; (3) it belongs to Proteobacteria, gamma subdivision; (4) it cannot assimilate glucose as a single carbon source; and (5) it efficiently assimilates at least one of 10-30C n-alkanes. This sequence represents a fragment of the 16S rDNA gene from the microbe of the invention, isolate Wf-1.
                                                                                                                                              contamination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        299

10;

The invention relates to a method for monitoring oil contamination of sea water by detecting, in the sea water, a microbe having the following properties: (1) it has no flagellum; (2) it is a Gram-negative bacterium; (3) it belongs to Proteobacteria, gamma subdivision; (4) it cannot assimilate glucose as a single carbon source; and (5) it efficiently assimilates at least one of 10-30c n-alkanes. This sequence represents isolate Wf-2.

The invention relates to a new method for the production of taxane and pacitaxel compounds that comprises culturing bacteria isolated from a plant species of Taxus or bacteria produced by mutating the isolated bacteria. The methods can be used for the production of taxanes such as pacitaxel, 10-deacetylcephalomannine, 7-epitaxol, 10-deacetyl-7-epitaxol, 7-epicephalomannine, baccatin III, 10-deacetyl-baccatin III, cephalomannine, taxagifine, delta-banzolyloxy taxagifine, 9-acetyloxy taxusin, 9-hydroxy taxagifine, delta-banzolyloxy taxane IC, or taxane IC (calmed). The taxane and paciltaxel compounds can be used for the taxanes and paciltaxel at a concentration of 1-25 mu g/l.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      307

strain DSM 8721. This is a reference standard for isolation o
closely related strains (more than 92% sequence identity, or
preferably more than 93% identity of 16S ribosomal DNA) which
produce thermostable alkaline endo-1,4-beta-D-xylanase, which
is useful in paper production and pulp bleaching. The strain
itself produces such a xylanase.

```
This sequence represents the 16S rRNA gene of Pseudomonas cepacia strain KKOI. Fragments of the nucleic acid sequence (see TO1872-T03316) are useful as primers and probes for the specific detection of P.cepacia strain KKOI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gggtgcttgcacctggtggcgagtggcgaacgggtgagtaatacatcggaacatgtcctg 128

The invention relates to a method for monitoring oil contamination of sea water by detecting, in the sea water, a microbe having the following properties: (1) it has no flagellum; (2) it is a Gram-negative bacterium; (3) it belongs to Proteobacteria, gamma subdivision; (4) it cannot assimilate glucose as a single carbon source; and (5) it efficiently a ssimilates at least one of 10-30C n-alkanes. This sequence represents isolate TE-9.
                                                                                                                                                                                                                                                                                                                                                                                                                          Monitoring of oil contamination of sea water - where oil contamination is evaluated by detection of a microbe having properties from e.g. having no flagellum, being a Gram-negative bacterium, belonging to Proteobacteria, gamma subdivision, etc. 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        239
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               164
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       181

The invention relates to a method for monitoring oil contamination of sea water by detecting, in the sea water, a microbe having the following properties: (1) it has no flagellum; (2) it is a Gram-negative bacterium; (3) it belongs to Proteobacteria, gamma subdivision; (4) it cannot assimilate glucose as a single carbon source; and (5) it efficiently assimilates at least one of 10-30C n-alkanes. This sequence represents a fragment of the 16S rDNA gene from the microbe of the invention, isolate K2-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monitoring of oil contamination of sea water - where oil contamination is evaluated by detection of a microbe having properties from e.g. having no flagellum, being a Gram-negative bacterium, belonging to

                                                                                                                   Novel bacterial strain ADP (ATCC 55464), isolated from atrazine-contaminated soil, is capable of degrading s-triazine cpds., including atrazine. In an attempt to identify the strain, the 16S ribosomal RNA sequence (T18760) was compared to that of Escherichia coli (T18759), Pseudomonas citronellolis ATCC 15674 (T18761-63), Pseudomonas aeruginosa (T18764), Pseudomonas testosteroni (T18765) and Pseudomonas cepacia (T18766). It was concluded that ADP is closely related to, but distinct from, P. citronellolis and P.
